Data Connector with Opera 3 SE
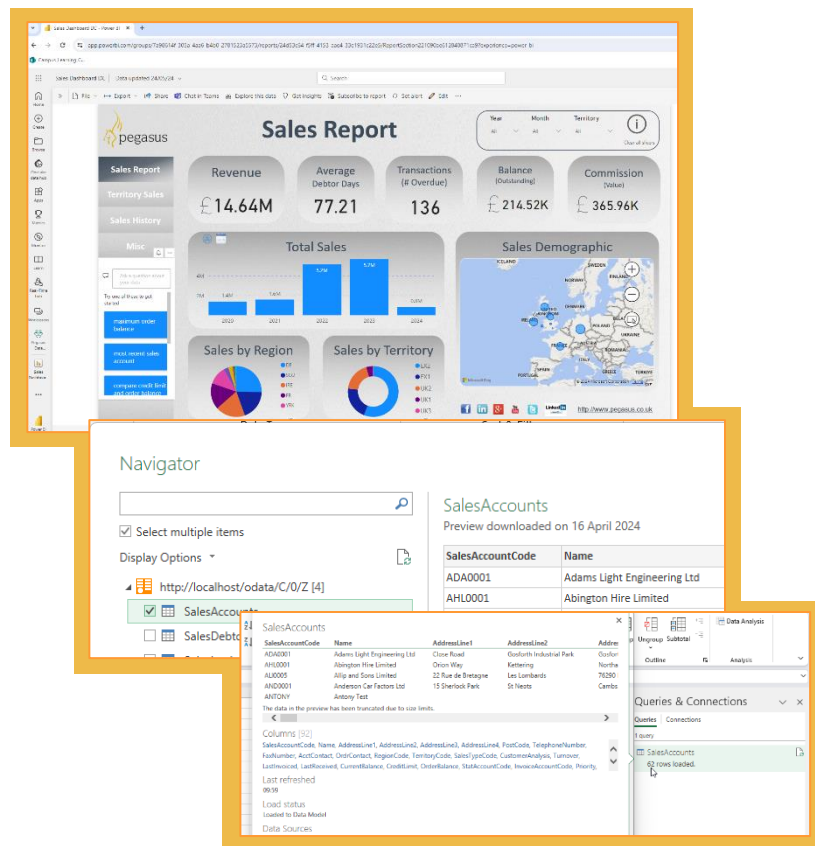

Take your data analysis to the next level

The Opera 3 SE Data Connector enables fast, secure and direct access to your data from Opera 3 SE and integrate it with business tools such as Microsoft Power BI, Excel and SharePoint enabling you to get even more insight into your business.

Data Connector: How does it work?

The Data Connector uses fast and modern technology to access data with flexible querying based on OData to access and extract information in an efficient and effective manner, whilst presenting an understandable dictionary with pre-defined links to make it extremely user friendly.

What can it be used for?

With the power of simple, secure data extraction at your fingertips, all data within Opera 3 SE, including any data held within added bespoke development can be analysed and reported on. Whether it is direct into Microsoft Excel or used to create Power BI Dashboards or to create business critical alerts, the Data Connector is the solution. Artificial Intelligence tools can also be used on the data to assist with answering those pressing questions!

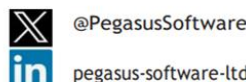

Imagine being able to access data from any part of your financial and business solution and then present that data in a form that can be easily digested and distributed around the company to non-financial users. Better still this information could be interrogated using latest AI tools for further decision making and even alerting you when limits have been exceeded for areas such as credit limits, below stock values and more. This is now a reality for Opera 3 SE users with the arrival of the new Data Connector.
